Transfer of Signals ....

$$Z_1 = \frac{2a(t-t_0) + b + j(\omega_c - \omega_0)}{2\sqrt{-a + c - j\pi(\gamma - \delta)}}, \quad (9a)$$

These formulae can be used for the analysis of various cases. If a signal step of variable frequency is applied to the filter, it can be assumed that in Eq. (10)  $a = b = c = 0$ . In this case, the output voltage is given by

$$u_{out}(t) = \frac{E_s K_s}{2p} e^{-\alpha(t-t_0)} e^{j(\omega_c t + \pi\gamma t^2 + \theta - \phi)} \cdot W \left[ \frac{p - j\sqrt{\alpha}(t-t_0)}{p} e^{-\pi} \right]. \quad (11)$$

This formula was used to construct the envelopes of the output voltage for various values of the parameter  $p$ . Some of these envelopes are illustrated in Fig. 1, where

$$\delta = (t - t_0 - t')/\tau_0/2,$$

where  $t' = (\omega_c - \omega_0)/2\pi(\gamma - \delta)$ ;  $\tau_0$  represents the Card6/10

24375

S/142/60/005/005/002/015  
E192/E382

Transfer of Signals ....

duration of the impulse response of the system. If a rectangular radio pulse of varying frequency is applied to the filter, the input signal is in the form:

$$e(t) = \begin{cases} E_0 e^{j(\omega_c t + \pi t^2 + \theta)} & \text{at } 0 \leq t \leq \tau_1; \\ 0 & \text{остальных } t, \end{cases} \quad (14)$$

where  $\tau_1$  is the duration of the input signal.

This signal can be represented as a sum of two continuous voltages  $e_1(t)$  and  $e_2(t)$ , one of which is applied at a time  $t = 0$ , while the second one is in antiphase and is switched-on at  $t = \tau_1$ . The output signal is therefore

given by the superposition of two functions of the type represented by Eq. (11). By using the resulting formulae, it was possible to evaluate the envelopes of the output signal and these are illustrated in Fig. 3. If the input signal is in the form of a Gaussian pulse which is represented

Card 7/10

24375

S/142/60/003/005/002/015  
E192/E382

Transfer of Signals ....

by:

$$E(t) = E_0 e^{-\beta(t-t_1)^2} \quad (16)$$

where  $\beta$  is a parameter determining its duration  $\tau_1$ ,  
the output voltage is shown to be in the form:

$$u_{\text{out}}(t) = \frac{E_0 K_0}{p} e^{-h_0^2} \cdot e^{-\frac{|\sqrt{a} (t-t_0-t_1) h_1 - h_2|^2}{p^2}} e^{i[\omega_0 t + \pi] + \theta - \phi + \psi(t)} \quad (19)$$

where  $p_0$  is the relative detuning between the frequency of  
the system  $\omega'_0$  at time  $t = t_1$ . On the basis of Eq. (19)  
it is easy to determine the maximum amplitude of the output  
pulses, their duration and the instantaneous frequency of  
the output signal.

TITLE: Chemical modification of chlorinated polyolefins by introduction of aromatic groups

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 11, 1965, 1946-1949

TOPIC TAGS: polyethylene, polypropylene, aromatization, oxidative degradation

ABSTRACT: The reaction of chlorine derivatives of low and high density polyethylene, atactic and isotactic polypropylene, and toluene in the presence of aluminum chloride was investigated. This work was performed to establish the possibility of arylation of polyolefins by the interaction of chlorine derivatives of the latter with benzene derivatives in the presence of aluminum chloride. The reaction was carried out in dichloroethane and carbontetrachloride solution at 0°C. UV and IR spectra of the arylated olefins were determined, and the thermooxidative degradation of the polymers was investigated. The experimental results

1160. Spectrum excitation by a powerful impulse spark in the analysis of tin bronzes. 2

Davidov, S. P. and S. P. Davidov. *Dokl. Akad. Nauk SSSR*, 1965 (4), 51-53. *Abstr. Chem.* 1966, Abstr. No. 25,982. The analysis of tin bronzes for Zn, Pb, Sn, Ni and Fe is carried out by using a low-tension generator of powerful impulse discharges (illustrated). The sample is cut

into two parts. One part is placed in a special holder and the other part is placed in a special holder. The holder is made of an insulating paste (resin + cork) between petroleum jelly (35-50 °C) and the sample is placed to a plastic washer of diam. 15 mm and thickness 1 mm with four equally spaced holes of diam. 1 mm. A special press fitted with pins forces the washer to the sample and presses the layer of paste, thus removing the insulation in four places. The spectra are photographed three times on the spectrograph ISP-22, with slit width 0.03 mm, with a spherical condenser. A pointed carbon electrode is used as the positive pole, the sample as the negative; the distance between the electrodes is 1-6 mm. The lines used for the analysis are: Sn 2840-0 and Cu 2824-4; Pb 2833-0 and Cu 2824-4; Fe 2755-7 and Cu 2824-4; Zn 2502-0 and Cu 2529-4; Ni 3050-8 and Cu 3003-4 Å. The analysis of the five elements may be carried out on one spectrum. During work on the method with three standards the mean square error was Pb ± 5.2%, Sn ± 4.6% and Zn ± 5.4%.

TITLE: Information from the Commission on Prestressed and Precast Reinforced Concrete Constructions (V Komissii po predvaritel'no napryazhennym i sbornym zhelezobetonnym konstruktsiyam)

PERIODICAL: Beton i Zhelezobeton, 1959, Nr 1, p 44 (USSR)

ABSTRACT: In December 1958, a session of the Commission on Prestressed and Precast Reinforced Concrete Construction was held in Moscow. This Commission was appointed by the Academy of Building and Architecture of USSR (Akademiya stroitel'stva i arkhitektury SSSR). The following papers were read: Programmes and Planning for 1959/1965 - N.K. Proskuryakov, Director of the Department of Concrete and Reinforced Concrete Constructions of Gosstroy of USSR; Report on the Commission's Activities in 1958 and Plans for 1959 - V.V. Mikhaylov and A.A. Gvozdev, Members of ASiA SSSR; Reports on the Third International Congress on Prestressed Precast Reinforced Concrete - S.S. Davydov, Vice-President of ASiA SSSR; V.V. Mikhaylov, Member ASiA SSSR; and

AUTHOR: Davydov, S. S.

TITLE: Armoplastbeton (Reinforced plastic concrete)

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 24, 1961, 369, abstract  
24K355 (Izv. Akad. str-va i arkhitekt SSSR, no. 4, 1960, 3-12)

TEXT: Armoplastbeton (reinforced plastic concrete) is a combination of plastic concrete (PC) or polymer concrete (PMC) with metal, or non-metal reinforcement. In PC cement is completely, and in PMC partially, replaced by polymers. The PC are divided into the following groups: on a furfural-acetone base, phenol-formaldehyde and carbamide resins, and acid tars in combination with  $\phi$ A (FA) monomer. The first variety of PC uses furfural-acetone monomer type FA, hardened by benzosulfonic or other acids. Consumption of monomer is 14 - 16 % of the PC weight, and of acid 16 - 25 % of monomer weight. Twenty eight days' compressive strength  $R_{compr}^{28}$  is on the average 400 - 700 kg./sq.cm. with very wide scatter of strength values. PC is dielectric, impervious to water and gas, resistant to alkali and

Card 1/3

Armoplastbeton (Reinforced plastic ...

S/081/61/000/024/060/086  
B149/B138

acids (except nitric); it can be used in construction both above and below the ground. The second variety of PC is coarsegrained expanded clay concrete (keramsitbeton), requiring only 25 - 35 kg. of resins per cu. m. of concrete.  $R_{compr.}$ , after one hour's heating at 120 - 150° is

15 - 30 kg./sq.cm. with bulk density of 350 - 500 kg./cu.m. The disadvantage of this concrete is low water resistance, which can be improved by adding monomer FA. In the third variety of PC the consumption of monomer is 2 - 4 %, and of tar 6 - 8 % by weight of PC.  $R_{compr.}^{28}$  is

150 - 200 kg./sq.cm. and its distinguishing property is high corrosion resistance. In PMC use is made of polyvinyl-acetate, or synthetic rubber latex emulsion.  $R_{compr.}^{28}$  of 1:3 PMC composition (by weight) with addition of 40 % polyvinyl-acetate emulsion (by weight of cement) is 320 kg./sq.cm. Bending strength  $R_{bend} = 136$  kg./sq.cm., impact resistance 4.6 kg.cm./cu.mt.

and absorption of water 2 %. PMC is good for floor surfaces. The corrosion resistance of cement concretes is substantially increased by adding of furil alcohol and aniline-hydrochloride in quantities of 50 and  
Card 2/3

B149/B138

5 lt./cu.m. of concrete.  $R_{\text{compr.}}^{28}$  is 400 kg./sq.cm.  $R_{\text{tens.}}^{28}$  in bending  
30 - 50 kg./sq.cm.  $\wedge$ , and axial tensile strength  $R_{\text{tens.}} = 16 - 25$  kg./sq.cm.

The paper under review describes the basic trends of scientific  
investigations, as well as prospects for use of reinforced plastics  
concrete. [Abstracter's note: Complete translation.]

TITLE: It Is Necessary to Improve the Construction and the Quality of the Production of the YM-5 (UM-5) Testing Machine

PERIODICAL: Zavodskaya laboratoriya, 1960, Vol. 26, No. 12, pp. 1439-1440

TEXT: In reply to the criticism of the testing machine mentioned in the title by P. M. Shulunov, the author says that the project of the machine concerned had been worked out by the Moskovskoye spetsial'noye konstruktorskoye byuro ispytatel'nykh mashin (Moscow Special Design Office of Testing Machines) (now NIKIMP (NIKIMP)) in 1955. The machine concerned had been produced in series from 1957 to September 1958 at the Armavirskiy zavod ispytatel'nykh mashin (Armavir Plant of Testing Machines), and this production was then passed on to the "Armalit" ("Armalit") plant. The zavod ispytatel'nykh mashin (Plant for Testing Machines) (ZIM) took a number of measures to improve the construction of the said testing machine. In 1958, three machines were submitted for testing to the Vsesoyuznyy

nauchno-issledovatel'skiy institut Komiteta standartov, mer i izmeritel'-nykh priborov (All-Union Scientific Research Institute of the Committee for Standards, Measures, and Measuring Instruments), which attested the usefulness of the machine. The criticized constructional faults were removed by the producing plant, and also mounting and operation of the machine on the spot were supervised. The novel construction of the machine, however, gave rise to unjustified criticism on the part of those who were not well versed with its operation. Finally, it is pointed out that the objections made by P. M. Shulunov in some cases do not conform with actual facts, as, the machine corresponds to the demands made by the standards ГOCT 7855-55 (GOST 7855-55), ГOCT 6996-54 (GOST 6996-54), and OCT-1683 (OST-1683). For 1961, technical measures for the improvement of the quality of the machine are provided for, and a plant specialized for the production of testing machines was charged with the production. The Armavirskoye spetsial'noye konstruktorskoye byuro (Armavir Special Construction Office) was ordered to modernize the machine UM-5.
